

## CLAIMS

I claim:

1. A dental appliance storage assembly comprising:
  - a base;
  - a tubular storage member, said tubular storage member having a conical bottom surface extending into an interior of said tubular storage member such that the toothbrush is urged into a non-vertical orientation when the toothbrush is positioned in said interior; and
  - a floss dispensing assembly coupled to said base.
2. The dental appliance storage assembly of claim 1 wherein said floss dispensing assembly is shaped to resemble a character.
3. The dental appliance storage assembly of claim 2 wherein said character has a torso portion and an arm portion, said torso portion forming a compartment for holding a roll of floss.
4. The dental appliance storage assembly of claim 3, further comprising:
  - a floss conduit extending from said compartment to an opening in said arm portion such that the floss is threadable through said conduit whereby the floss appears to be produced from said arm portion of said character.
5. The dental appliance storage assembly of claim 1, further comprising:

an audio device coupled to said base for producing a sound during use.

6. The dental appliance storage assembly of claim 5 wherein said audio device is an am/fm radio.

7. The dental appliance storage assembly of claim 1 wherein said tubular storage member is removable from said base.

8. The dental appliance storage assembly of claim 1 wherein a bottom section of said tubular storage member is threaded; and said base including a threaded portion complimentary to said threading of said tubular storage member.

9. The dental appliance storage assembly of claim 1 wherein said tubular storage member includes a bottom portion and a top portion, said top portion being separable from said bottom portion.

10. The dental appliance storage assembly of claim 9 wherein said top portion has an open bottom couplable to said bottom portion, a closed top, and a plurality of slits positioned proximate said closed top for providing ventilation into said tubular storage assembly when said top portion is coupled to said bottom portion.

11. The dental appliance storage assembly of claim 5 wherein said audio device is shaped to resemble a juke box.

12. The dental appliance storage assembly of claim 9 wherein said bottom portion has an open top couplable to said top portion, a closed bottom, and a plurality of slits positioned proximate said

closed bottom for providing ventilation into said tubular storage assembly when said top portion is coupled to said bottom portion.

13. The dental appliance storage assembly of claim 5 wherein said audio device includes means for playing sounds from a pre-recorded medium.

14. A dental appliance storage assembly comprising:  
a base;  
a tubular storage member, said tubular storage member having a conical bottom surface extending into an interior of said tubular storage member such that the toothbrush is urged into a non-vertical orientation when the toothbrush is positioned in said interior; and  
an audio device coupled to said base for producing a sound during use.
